On the front page of this leaflet it gives the overall costs of a set of Gates with a good quality Automation System installed with Radio Controls. This Page deals with some of the optional Control devices you may require in addition to the Radio Remotes.

GSM Intercom uses the Mobile phone network to call your Landline or Mobile Phone. You can then speak to a visitor and open the gates from your phone (Integral Keypad Included) **Installed £995 Plus VAT**

Price for multiple call buttons on application

Wireless Intercom uses a digital wireless signal to connect to handsets inside the property. You can then speak to a visitor and open the gates (Integral Keypad Included) **Installed £895 Plus VAT**

Keypad

This enables Tradesman, Friends & Family to gain entry with a pin code. Usually there are 2 separate functions that can be programmed, allowing both gates to be fully opened with one code and one gate leaf Partially opened for pedestrians with the second code

Installed £270 Plus VAT

Exit Ground Loop

This would be cut into or buried under your driveway, it is an induction device that detects metal objects like a vehicle and triggers the gate to open.

This is very useful for allowing visitors to leave, having been let in via the Intercom System or Keypad

Installed depending on drive surface From **£350 Plus VAT**

Exit Push Button

This would normally be sited on one of the inside Safety Beam posts, and would be used by pedestrians to exit through one gate leaf which would open partially when the button is pressed and close automatically after a short time delay.

Installed £95 plus VAT

GATES are supplied with hinges, wall fixing plates and Ring Latch as standard.

POSTS 100mm x 100mm with ball tops or back weathered caps

Mock Ornamental Hinges

INSTALLATION

Important

We wish to point out that timber is a natural product and is prone to movement, especially in the case of Standard softwood products. We cannot be held responsible for movement, shrinking, expansion and shaking of our products, and we take every avenue possible to minimise this, but cannot guarantee against this. It is very important that when hanging gates (especially softwood products) suitable two way adjustable fittings are used to offset any possible movement that may occur.

Softwood Gates

We manufacture our softwood gates using Siberian Larch a slow growing extremely durable and long lasting timber.

This timber does not require treatment and will weather down to a silver finish over time, it is a very stable wood that has minimal movement, twisting or splitting.

The timber can also be treated for appearance with Rubio Monocoat Oil, or if painting would need a coat of aluminium oxide primer as a base coat.

Hardwood Gates

We manufacture our Hardwood gates using kiln dried Iroko a slow growing extremely durable and long lasting timber.

This timber does not require treatment and will weather down to a silver finish over time, it is a very stable wood that has minimal movement, twisting or splitting.

Iroko Timbers are partly inconsistent in colour due to species type, so coating with Rubio Royal oil does help to even this out making it more consistent or over time if not treated will weather to an even finish

The timber can be treated for appearance with Rubio Monocoat Oil, or if painting would require a coat of aluminium oxide primer as a base coat.

Gateposts

We use 150mm x 150mm RHS zinc treated and painted posts which is the best option for automated gates.

The posts are hollow allowing cables to be hidden inside, there are no maintenance problems and they will not rot in the ground like timber. Most timber posts are Constructional oak and therefore do not match the gate timbers and tend to split and twist and eventually look unsightly.

We work with a large and varied range of timbers sourced throughout the world and we endeavour to make every effort to purchase timbers from renewable sources wherever possible.
